

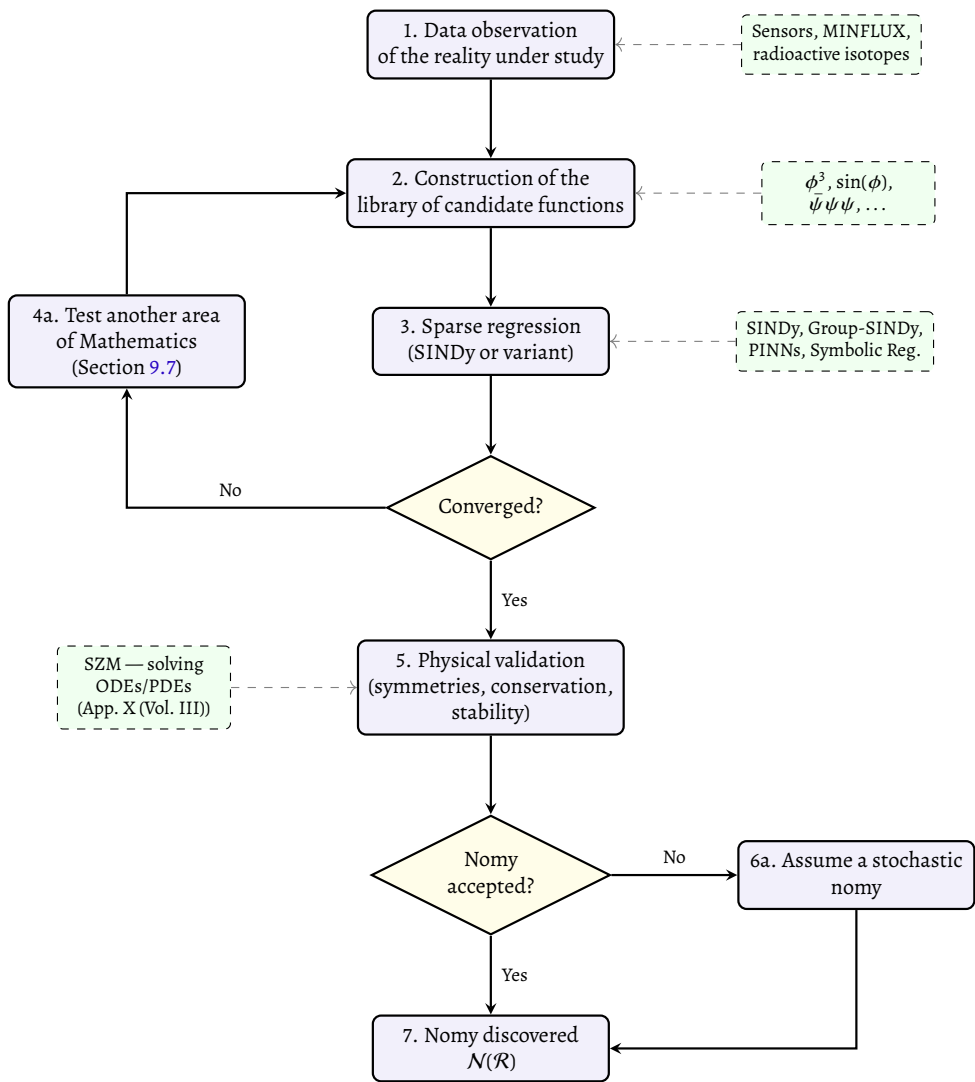

Figure 41 – Flowchart of the nomy discovery process. The main cycle (center) starts from data observation, passes through the construction of functional libraries, sparse regression, and physical validation. If the regression does not converge with the available mathematical tools, another area of Mathematics is explored (left branch). If validation fails repeatedly, one may assume a stochastic nomy (right branch). The computational tools (green, on the right) and the SZM (green, on the left) feed the corresponding stages.
