

Hydrogen Atom — Reinterpretation

The electron is at rest. The “cloud” is our ignorance.

- Proton — baryon (subnomy $\mathcal{A}$)
- Electron — lepton (subnomy $\mathcal{B}$, disconnected time)
- Equally possible positions (epistemic ignorance)
- ... Resulting electric field $\sim 1s$ orbital

Figure 57 – Ontological reinterpretation of the hydrogen atom. The proton (red, center) and the electron (dark blue) belong to subnomies with disconnected temporal structures. The light blue shadows do not represent an electron in motion, but the distribution of epistemically possible positions — denser where the Coulomb attraction is greater. The dotted curves indicate the resulting electric field, whose geometry coincides with the radial density of the $1s$ orbital. In this model, the electron is at rest; the “cloud” is our ignorance, not its nature.
