

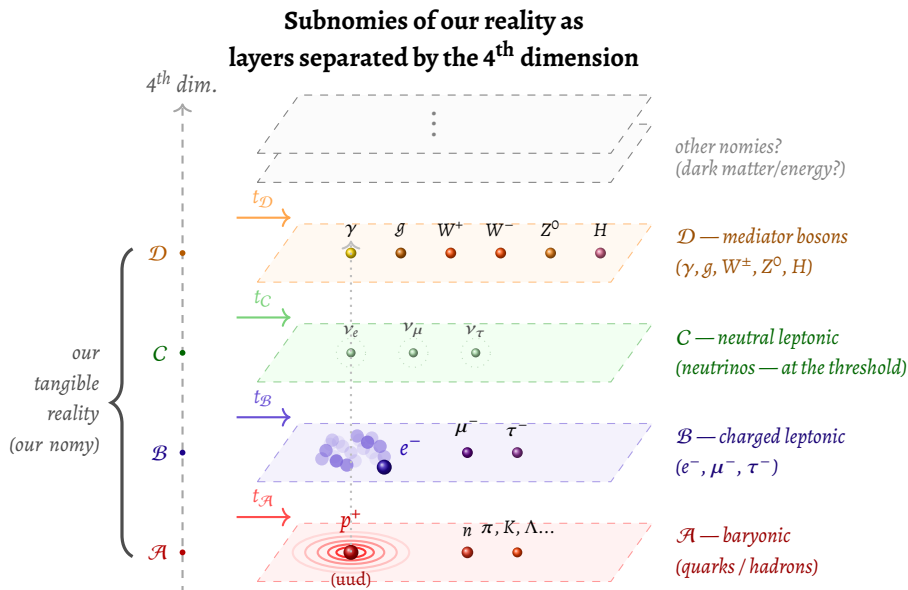

Figure 57 – Ontological layered representation of the subnomies that compose our nomy (tangible reality). Each layer corresponds to a distinct subnomy, separated from the others by the fourth dimension. In the baryonic layer $\mathcal{A}$, the proton p^+ (composed of uud quarks) generates an electric field with a characteristic radial profile. In the charged leptonic layer $\mathcal{B}$, the electron e^- occupies a specific position — unknown to an observer in layer $\mathcal{A}$ —, represented by the *cloud of ignorance* (blue shadows) concentrated around the vertical projection of the proton, giving rise to the 1s orbital. Layer $\mathcal{C}$ (neutrinos) lies at the *threshold* of our nomy, almost decoupled from the other subnomies. Layer $\mathcal{D}$ houses the mediator bosons of the fundamental interactions. Each layer has its own temporal structure ($t_{\mathcal{A}}, \dots, t_{\mathcal{D}}$), disconnected from the others. Above the brace are indicated, hypothetically, other nomies possibly not detectable by our instruments — possibly associated with dark matter and dark energy.
