

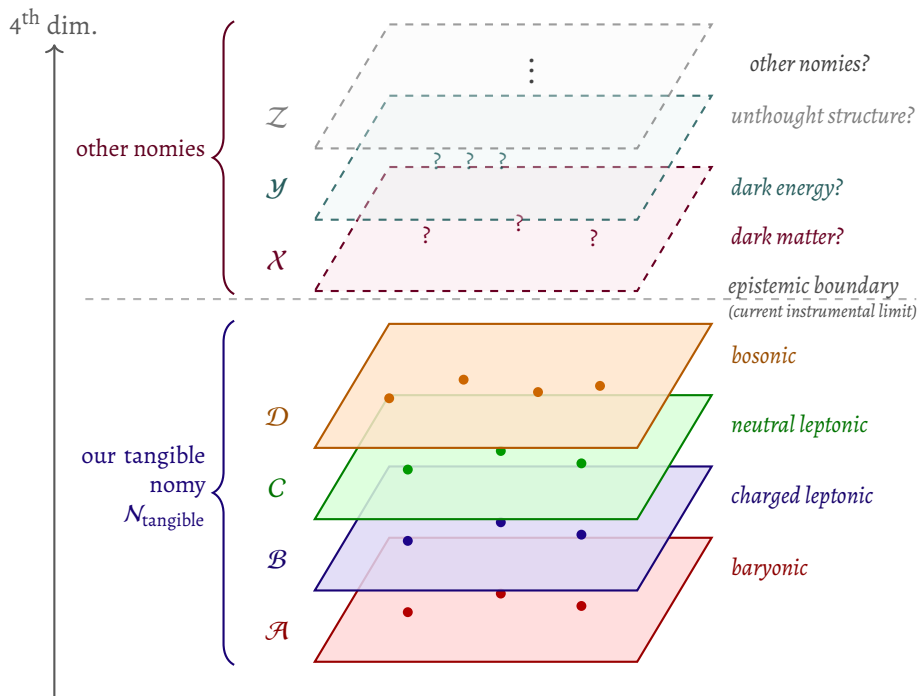

Figure 59 – **Speculative** extension of the layered representation along the fourth dimension (cf. Figure 57). Below the epistemic boundary, the four subnomies of our tangible nomy $\mathcal{N}_{\text{tangible}}$ are stacked: $\mathcal{A}$ (baryonic), $\mathcal{B}$ (charged leptonic), $\mathcal{C}$ (neutral leptonic), and $\mathcal{D}$ (bosonic) — *solid* layers, detectable by current instruments. Above the epistemic boundary (horizontal dashed line), *dashed and progressively faded* layers represent hypothetical nomies: $\mathcal{X}$ could correspond, speculatively, to dark matter; $\mathcal{Y}$, to dark energy; $\mathcal{Z}$ and the layers above represent structures still unthought or inaccessible. The epistemic boundary is *historical and instrumental*: should fundamental particles unknown today come to be discovered, we adopt, by convention, that they will inhabit layers distinct from $\mathcal{A}, \mathcal{B}, \mathcal{C}, \mathcal{D}$ — that is, outside the tangible nomy as defined in this book. This figure **does not represent parallel realities** in Everett’s sense: the layers illustrated here coexist in the same 4th dimension, but are mutually inaccessible to the instruments typical of each nomy.
