

Figure 10 – Schematic diagram of the maximum amplitude of the electric field as a function of frequency, for a given potential amplitude  $V_0$ . In the linear regime ( $f < f_{\text{crit}}$ ),  $|\vec{E}|$  grows proportionally to  $f$  (blue line). Upon reaching  $E_{\text{crit}}$ , the restitutive nonlinearity comes into play and limits the growth of the field (red curve), forming localized excitations. The dashed gray line indicates what would occur without suppression.
