

Our tangible nomy as an n-tuple of subnomies coupled by the operator $\otimes$

(ontological layers of ONE single nomy —
they are NOT parallel realities)

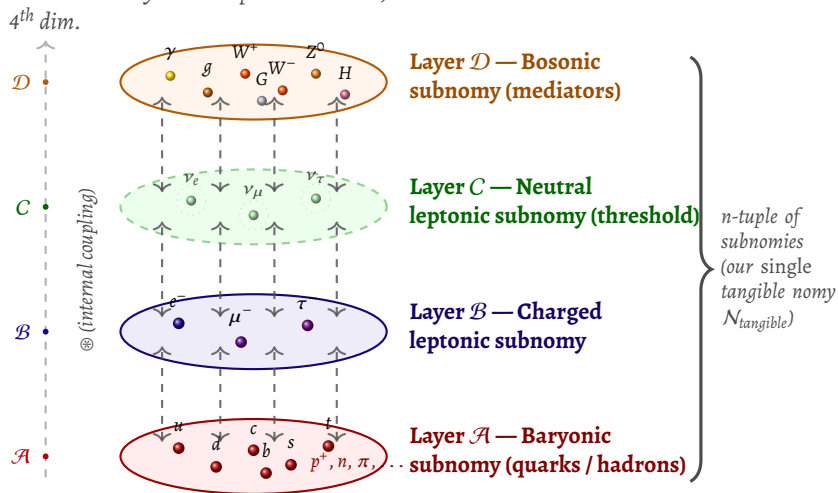

Figure 59 – Schematic representation of our tangible nomy $\mathcal{N}_{\text{tangible}}$ as an **n-tuple of subnomies**, arranged in distinct ontological layers: $\mathcal{A}$ (baryonic), $\mathcal{B}$ (charged leptonic), $\mathcal{C}$ (neutral leptonic, at the threshold), and $\mathcal{D}$ (bosonic). The vertical dashed arrows represent the coupling $\otimes$ between subnomies, encoding the structure $C = (\mathcal{M}, \mathcal{R}, \mathcal{A})$ of mixing, shared representation, and anomaly conditions (Chapter 14). **Crucial observation:** the disks do NOT represent independent parallel realities, but rather *sectors (subnomies)* of the same *tangible nomy*, internally coupled. The proton–electron interaction (Figures 54 and 56) manifests itself as the coupling $\mathcal{A} \otimes \mathcal{B}$.
